Regarding claim **10** and subsequent dependent claims, prior art of record fails to teach or render obvious, alone or in combination a method of operating a network entity at an intermediate node between a mobile node in a foreign network and a correspondent node, the method comprising: allocating a secondary care-of address to the network entity; sending a packet addressed to the correspondent node from the network entity, wherein the correspondent node has a unique address, wherein the

packet comprises a binding update, and wherein the binding update comprises an indication of the secondary care-of address; receiving from the correspondent node a packet addressed to the secondary care-of address of the network entity and having the unique correspondent node address as the source address, wherein the packet is a session packet in a session between the correspondent node and the mobile node, and wherein the session packet is tunnelled from the correspondent node to the network entity, in combination with all other disclosed limitations as recited in independent claim 10.

Regarding claim **14** and subsequent dependent claims, prior art of record fails to teach or render obvious, alone or in combination a method of operating a network entity at a node of a packet-switched data network, wherein the network entity acts as an intermediate node between a mobile node having a care-of address in a foreign network and a correspondent node, the method comprising: allocating a secondary care-of address to the network entity, the secondary care of address corresponding uniquely to a home address of the mobile node; sending a packet addressed to the correspondent node from the network entity, wherein the correspondent node has a unique address, wherein the packet has the secondary care-of address as a source address, wherein the packet comprises a binding update, and wherein the binding update comprises an indication of the secondary care-of address; and receiving a packet for the mobile node addressed with the secondary care-of address and having the unique correspondent node address as the source address, wherein the packet is a session packet in a session between the
